

Tribal Vector-Borne Disease Prevention & Control Workshop

ALBUQUERQUE, NM June 28-29, 2018

VECTOR

- Transmitters of disease-causing organisms that carry a pathogen from one host to another
- Any living creature that transmits an infectious agent to humans
- Vectors are frequently arthropods, such as mosquitoes, ticks, flies, and fleas

Vector-Borne Disease Transmission

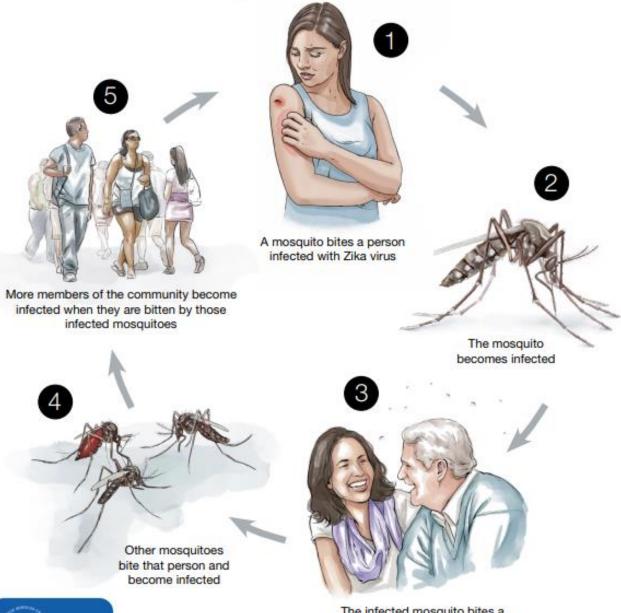

BIOLOGICAL

vectors such as mosquitoes and ticks may carry pathogens that can multiply within their bodies and be delivered to new hosts, usually by biting.

MECHANICAL

vectors such as flies can pick up infectious agents on the outside of their bodies and transmit them through physical contact.

Most people get Zika from a mosquito bite

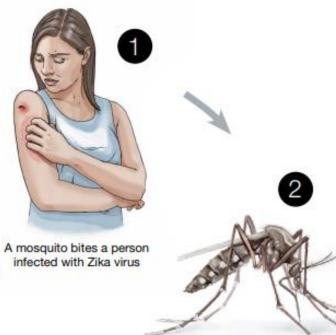

Most people get Zika from a mosquito bite

More members of the community become infected when they are bitten by those infected mosquitoes

Other mosquitoes bite that person and

become infected

The mosquito

becomes infected

3

The infected mosquito bites a person and infects them with Zika

Other ways people get Zika

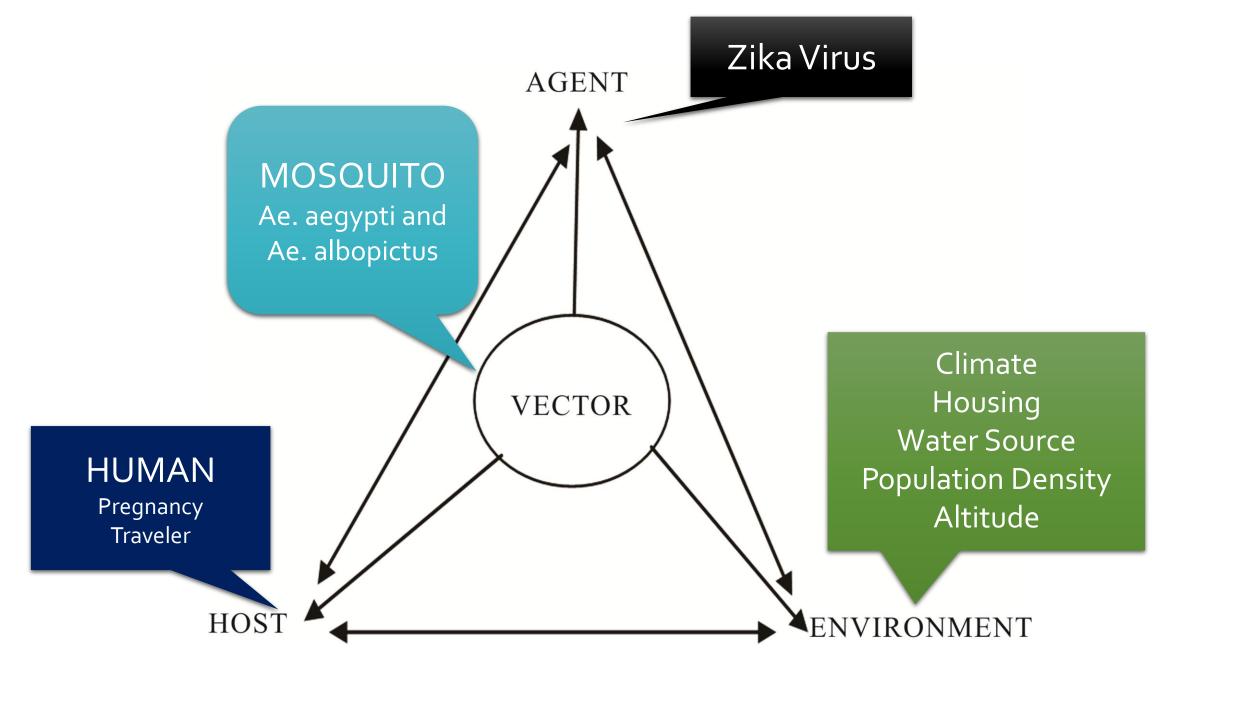

A pregnant woman can pass Zika virus to her fetus during pregnancy. Zika infection during pregnancy can cause serious birth defects and is associated with other pregnancy problems.

Through sex
Zika virus can be passed
through sex from a person
who has Zika to his or her
sex partners.

Through blood transfusion Zika virus may be spread through blood transfusion.

Workshop Focus

- Zika Virus
- West Nile Virus
- Hantavirus
- Plague
- Rabies

Principles for Vector-Borne Disease Prevention & Control

- Surveillance and monitoring
- Case management
 - Diagnosis
 - Treatment
 - Patient care
- Effective personal and community protection
- Communication & education
- Partnerships & collaboration
